

Study Guide for IST 4352 Test 1

Here are things that you can expect to be asked to do on our first exam (Thursday):

1. Write an app with one button and one label that will allow the user to press a button that will put some text in a label.
2. Write an app with several buttons and one label that will put different text in the label depending on which button was pressed.
3. Write an app with several buttons and two labels that will put different text in a given label depending on which button was pressed.
4. Debug an existing program with errors in it to get it first to compile without errors and then to run without crashing.

All of these are identical or similar to things we have done in class. Feel free to use any previous examples or homework as a template. You may also use your textbook and any handouts I have provided. I will have the actual mac minis in the lab so that you don't need to mess with VNC. Let me know if you have questions!
